 Milton, FL 32570

Pollinator Garden: Plants grown in this section are carefully selected to attract a wide variety of pollinators like bees, butterflies, other beneficial insects, and even bats.

Aquaponics: A close loop system in which the waste produced by fish supplies nutrients for plants grown hydroponically, which in turn purify the water.

High Tunnel: With pounding rain and freezing temperatures, it is important to have the ability to cover crops throughout the year. This structure extends the growing season and quality.

Hydroponics: Using vertical pipes and an internal nutrient injected water misting system, plants are able to obtain their nutrients and occupy less space than soil gardening.

Vermiculture: Red worms are used to break down organic waste and convert it to a nutrient rich soil amendment.

Pond: Planted with native species from the wetlands on the property, providing a year long wildlife habitat.
